

The graph displays the training loss for two different models over 2000 epochs. The 'Model 0 loss curve' shows high-frequency oscillations, while the 'Ensemble data loss' shows a smoother, overall decreasing trend.

Epoch	Model 0 loss curve	Ensemble data loss
0	0.12	-
500	~0.05	~0.05
1000	~0.05	~0.05
1500	~0.05	~0.045
2000	~0.05	~0.01

Figure 1 is a line plot showing the training loss of the proposed method across 2000 cumulative epochs. The y-axis represents the Loss, ranging from -0.100 to 0.075. The x-axis represents the Epoch (cumulative), ranging from 0 to 2000. The plot compares the performance of three models: M1, M2, and M3, each with dual, data, and ensemble (ens) components.

The legend identifies the following series:

- M1 dual (solid purple line)
- M1 data (dashed purple line)
- M1 ens (dotted purple line)
- M2 dual (solid teal line)
- M2 data (dashed teal line)
- M2 ens (dotted teal line)
- M3 dual (solid yellow-green line)

Key observations from the plot:

- M1:** The dual and data components start at high loss (around 0.08) and decrease to stabilize around 0.015 by epoch 600. The ensemble component starts at a low loss (around -0.075) and increases to stabilize around 0.000 by epoch 600.
- M2:** The dual and data components start at high loss (around 0.08) and decrease to stabilize around 0.015 by epoch 1000. The ensemble component starts at a low loss (around -0.075) and increases to stabilize around 0.000 by epoch 1000.
- M3:** The dual component starts at a high loss (around 0.08) and decreases to stabilize around 0.015 by epoch 1500. The data component starts at a high loss (around 0.08) and decreases to stabilize around 0.015 by epoch 1500. The ensemble component starts at a low loss (around -0.075) and increases to stabilize around 0.000 by epoch 1500.

Vertical dotted lines are present at epoch 1000 and epoch 1500, indicating specific points of interest in the training process.
